

Military Applications

Training pilots is an expensive proposition. Advanced training requires familiarity and then proficiency. Until now, achieving this goal using high fidelity simulators has been the preferred method.

HotSeat Chassis[®] flight simulators are used for low fidelity and a medium fidelity skill development. Implementation of this *Progressive Fidelity*[™] strategy significantly reduces the total cost of pilot training. Here are some of the Military applications we have executed and we can offer Combat Sims, HeliSims, FAA Approved Yoke & Pedal and Stick and Throttle designs. All can be fitted to our *Motion Flight Sim*[®] platform. Custom placement of multiple touch screens or other accessories can be easily installed on all of our simulators.

All Chassis include our 6 speaker 5.1 Dolby[®] Digital surround sound system capable of redirecting to a head set delivering the *In the Cockpit Experience*[®]
